FinBank — Analytics Platform Requirements

Document reference: FB-ARCH-2026-07 · Prepared by the FinBank Data Office (fictional organisation)

1. Background

FinBank is a mid-sized retail bank operating in three countries. Our current data warehouse is reaching its capacity limits and analysts wait hours for reports. We are evaluating modern data platforms to consolidate reporting, risk analytics and regulatory data preparation on a single platform.

This document lists the requirements the selected platform must meet. It is shared with vendors for evaluation purposes only. Terms such as 'the platform' refer to the vendor's proposed solution.

2. Evaluation approach

Vendors will be assessed against the numbered requirements in section 3 and the integration table in section 4. Responses should reference publicly available product documentation wherever possible.

3. Requirements

1. The platform must be deployable on-premises in FinBank's own data centres.
2. All customer data must remain within FinBank-controlled infrastructure at all times.
3. The platform must support an air-gapped deployment with no outbound internet connectivity.
4. The platform should be compatible with FinBank's existing data ingestion pipelines.
5. Access control must be granular, role-based and enforceable down to individual columns.
6. The platform must comply with the FinBank Internal Security Standard FBS-114.
7. The vendor should provide an estimate of the migration effort from FinBank's existing data platform.
8. The solution must be compliant with all applicable banking regulations.

4. Existing ingestion landscape

For reference, the table below summarises FinBank's current ingestion pipelines (fictional).

Pipeline	Source	Frequency
Core banking extract	Relational database (JDBC)	Nightly
Card transactions	Message queue	Near real-time
Risk models	Files in object storage (Parquet)	Daily

5. Contact

Questions about this document can be sent through the vendor evaluation portal.
